Dashboard Questions:

1. After filtering the dashboard to West Division, with the Department set to "All" and the full salary range selected, the results showed a headcount of 2,863, an average salary of $44,316.07, and a median salary of $35,643.51. The difference between the average and median salaries is likely caused by a small number of highly paid employees pulling the average upward, while the median better represents the salary of a typical employee.
2. When viewing the salary distribution by division without filters, the box plot is difficult to read because several employees have extremely high salaries compared with the majority of employees. For example, the South Division contains an outlier exceeding $1 million, which stretches the vertical axis and compresses the boxes near the bottom of the chart. To improve readability, I narrowed the salary range to 26,003 - 100,000, kept all five divisions selected, and left the Department filter set to "All". This allows the salary distributions of typical employees to be compared more clearly without the extreme outliers dominating the chart.
3. For the entire company, the 60+ age band has the highest average salary at approximately $70,000, based on only 201 employees. After selecting the Operations department, the highest-paying age band was 60+, with an average based on 12 employees. This demonstrates why averages should be interpreted carefully, because a relatively small group of highly paid employees can increase the average substantially and make it less representative of the larger workforce.
